

**19.11.2015 - Illiterate women from villages around the world with no electricity attend a course to learn how to make solar panels in India, coming back home as 'solar engineers'. This was the plot of Ciné-ONU's latest screening on 18 November 2015 at the Italian Cultural Institute. It's a tale about crossing borders and pushing boundaries for women's empowerment, renewable and sustainable energy, and development.**

Bring the Sun Home was screened to celebrate the International Year of Light, which is a global initiative stressing the importance of light in people's lives, for their futures, and for the development of society. The UN recognizes that light has revolutionized medicine, opened up international communication via the Internet, and continues to be central to linking cultural, economic and political aspects of the global society.

The film documents the empowerment of women in rural areas in developing countries while encouraging the use of renewable and sustainable energies.
